

Luciano González

Backend Developer • PHP & Laravel

lucianogonzalez12004@gmail.com • +54 9 223 305 4493 • [LinkedIn](#) • [GitHub](#) • Argentina • Open to remote work

PROFILE

Backend developer specialized in PHP, Laravel, and MySQL. I work on a multi-institution education management platform, building REST APIs, business logic, and both financial and academic modules, with hands-on experience in payment gateway integrations and legacy code modernization. I complement that experience with personal projects built on Laravel, PostgreSQL, and Docker, focused on architecture, concurrency, and best practices.

EXPERIENCE

Backend Developer

CONED • September 2025 – Present

- Integrated the SIRO, CES, and Mercado Pago payment gateways using Laravel, implementing payment synchronization, automatic receipt updates, and student account activation based on balance status.
- Developed REST endpoints, validations, and business logic in PHP/Laravel for financial modules: invoicing, outstanding debt, current accounts, and receipts.
- Maintain and modernize academic modules (exam boards, students, subjects, courses, class groups, and enrollments) within a multi-institution platform.
- Optimized SQL queries on MySQL and refactored legacy code, improving performance on high-volume data processes.
- Automated internal processes through Artisan commands and scheduled tasks, and implemented role- and permission-based access control.
- Integrated backend endpoints with the Angular frontend and resolved production incidents through debugging and error analysis.

Full Stack Developer Intern

CONED • May 2025 – July 2025

- Built an onboarding platform for creating and configuring new educational institutions, streamlining the system setup process.
- Contributed to a support system featuring ticket management, CRM, and application usage statistics.

PROJECTS

ReservaHub — Multi-tenant appointment booking SaaS • [Live demo](#) • [Source](#)

- Built with Laravel 13, PHP 8.5, PostgreSQL, Redis, Inertia + React 19, and Docker, with PHPUnit tests and CI on GitHub Actions.
- Availability engine that computes open slots by combining employee schedules, breaks, time off, and holidays; overlap prevention is re-validated inside the transaction using PostgreSQL advisory locks.
- Simulated payment gateway behind a decoupled contract, with idempotent webhooks and a reconciliation command comparing local state against the provider.
- Multi-tenancy through global scopes and policies, real-time updates via Laravel Reverb, REST API authenticated with Sanctum, and a UI available in Spanish and English.

TECH STACK

Backend: PHP, Laravel, REST APIs, Sanctum, Composer

Databases: MySQL, PostgreSQL, Redis, query optimization

Frontend: Angular, React, Inertia, TypeScript, JavaScript, HTML5, CSS, TailwindCSS, Bootstrap

Infrastructure & testing: Docker, GitHub Actions (CI), PHPUnit, Git

Other languages: Java, Python, C

EDUCATION

High School Diploma in Economics and Administration

Instituto Argentino Modelo • Completed in 2021

Programming Course

CFP N°401 • 2022 • Introduction to C, Python and MySQL fundamentals

LANGUAGES

Spanish — Native English — B2 Intermediate
